#### 4.5 konig's theorem

In any bipartite graph, the number of edges in a maximum matching equals the number of vertices in a minimum vertex cover

### 4.6 minimum path cover in DAG

Given a directed acyclic graph G = (V, E), we are to find the minimum number of vertex-disjoint paths to cover each vertex in V.

We can construct a bipartite graph  $G' = (Vout \cup Vin, E')$  from G, where :

```
Vout = \{v \in V : v \text{ has positive out } - degree\}
Vin = \{v \in V : v \text{ has positive in } - degree\}
E' = \{(u, v) \in Vout \times Vin : (u, v) \in E\}
```

Then it can be shown, via König's theorem, that G' has a matching of size m if and only if there exists n-m vertex-disjoint paths that cover each vertex in G, where n is the number of vertices in G and m is the maximum cardinality bipartite mathching in G'.

Therefore, the problem can be solved by finding the maximum cardinality matching in G' instead.

**NOTE:** If the paths are note necesarily disjoints, find the transitive closure and solve the problem for disjoint paths.
